

Community Update

October 2024

As part of our Local Network Battery Plan, we're installing a battery energy storage system in your community.

We're looking to the future.

Ergon Energy Network and Energex are investing in energy storage to support the growing level of rooftop solar energy systems in your area.

We've already installed six utility-scale 4MW/8MWh batteries across the state and currently have another twelve on the way.

Queenslanders are putting solar on their homes and businesses at world record rates, with more than 40% of houses already benefitting.

The clean energy generated could double by 2030, with well over a million rooftops exporting into our electricity networks as we transition to a net zero emissions future.

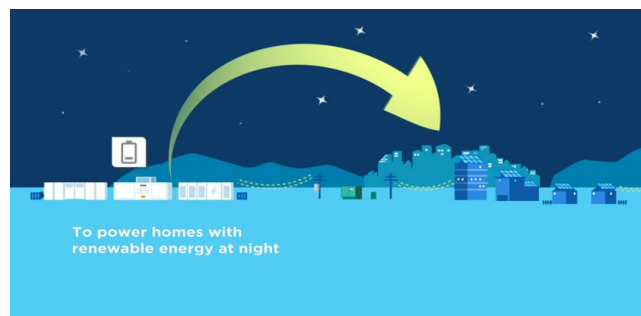

The batteries will enable more solar locally, without impacting on the security or stability of the local electricity network.

This is just one of the ways we are enabling the transition to renewable energy future and, ultimately, helping to keep electricity prices down.

How will the batteries work?

They will soak up the excess solar energy generated by the community during the day and store it locally.

Then, when the sun goes down, the stored energy will go back into the grid for use during the evening peak when demand for electricity is high.

Where is the battery being located?

The battery system will be located within the Ergon substation on Rocky Street, Maryborough.

Location of the new battery within Rocky Street Substation.

What will the battery look like?

The battery installation will have rows of modern, modular battery banks, with communications and electrical switching equipment.

The battery site will be securely fenced within an acoustic timber fence.

Building batteries for cleaner power

Where is the project up to?

Early preparatory and other civil works, to prepare the site for the installation of the battery and the other electrical equipment, have commenced. The first phase of the works, removal of old concrete foundations and earthworks, is the most active. Noise, dust, and localised vibration from machinery can be expected during this period and will continue for approximately two weeks.

We thank the surrounding community in advance for their patience while this work proceeds. There will be an increase in heavy vehicle movement into and out of the site, as well as a range of site personnel working and parking in the area.
