

# PLOTTING MAP

Print out and use this plotting map to help you keep track of the cyclone's movements. When the Bureau of Meteorology issues an advise the position of the cyclone is given both as a longitude and latitude reading and as a 16 point compass bearing. To plot the cyclone use the longitude (vertical lines) and latitude (horizontal lines) readings issued and mark them on the plotting map below. Remember that the readings are given for the eye of the cyclone, that is the centre. Gale force winds may be experienced on the coast many hours and hundreds of kilometres ahead of the cyclone's centre.
