

Boulia Solar Farm Project Update

Part of Energy Queensland

September 2026

We're continuing to make great progress on site, with clear blue skies and plenty of iconic Boulia red dirt setting the scene as works move ahead.

Civil works are progressing well and remain on track for completion in early October. Recent activities have included surveying, foundation works, trenching for conduits connecting to the control room, and preparation of the site pad for the installation of the control building. These activities mark an important step forward as the project begins to take shape on site.

New amenities building at the Boulia Solar Farm.

The next stage on the project is to prepare the steelwork for the control building. The building is now being prepared to be transported the 1,700kms from Ergon's Banyo workshop in Brisbane, to the Boulia Solar Farm site.

In October the building is due to arrive on site, where it will be craned into place on the steelwork foundations and secured.

The control building will travel over 1,700kms from Ergon's workshops at Banyo in Brisbane to site at Boulia.

The Boulia Solar Farm is scheduled to be operational by March 2027.
